Queuing System Automation Execution Report

IT302 Activity 9 | Group 1 | 29 October 2026

The corrected sample meets the five-case demo exit criterion. The baseline intentionally fails duplicate-ticket prevention. These are local Selenium executions of the bundled classroom app supporting a theoretical submission; they are not test results from the deployed group prototype.

Scope and traceability

Activity 5 uses CampusConnect. New QTC/QR identifiers explicitly adapt its login, lockout, password-length, duplicate-prevention and successful-transaction principles for a queuing system. Activity 8 informs the small UI suite, Page Objects, explicit waits, synthetic data and CI strategy. Student MFA and enrollment rules are not claimed as queue requirements.

Automation / Manual	Activity 5 basis	Scenario	Run 1	Run 2
AUTO-Q01 / QTC-01	TC-01 / R1	Valid staff login	PASS	PASS
AUTO-Q02 / QTC-03	TC-03 / R3	Reject seven-character password	PASS	PASS
AUTO-Q03 / QTC-02	TC-02 / R2	Lock account after five wrong passwords	PASS	PASS
AUTO-Q04 / QTC-04	TC-06 / R6	Prevent duplicate queue ticket	FAIL	PASS
AUTO-Q05 / QTC-05	TC-08 / R7	Create a valid queue ticket	PASS	PASS

Environment and outcomes

Python 3.12.14; Selenium 4.51.0; pytest 8.3.3; headless Chrome 156.0.8078.73 on Windows; 1365 x 1000 window. Auto-assigned loopback URL. Synthetic staff.demo and customers CUST-001 / CUST-002. Fresh browser and reset state per case.

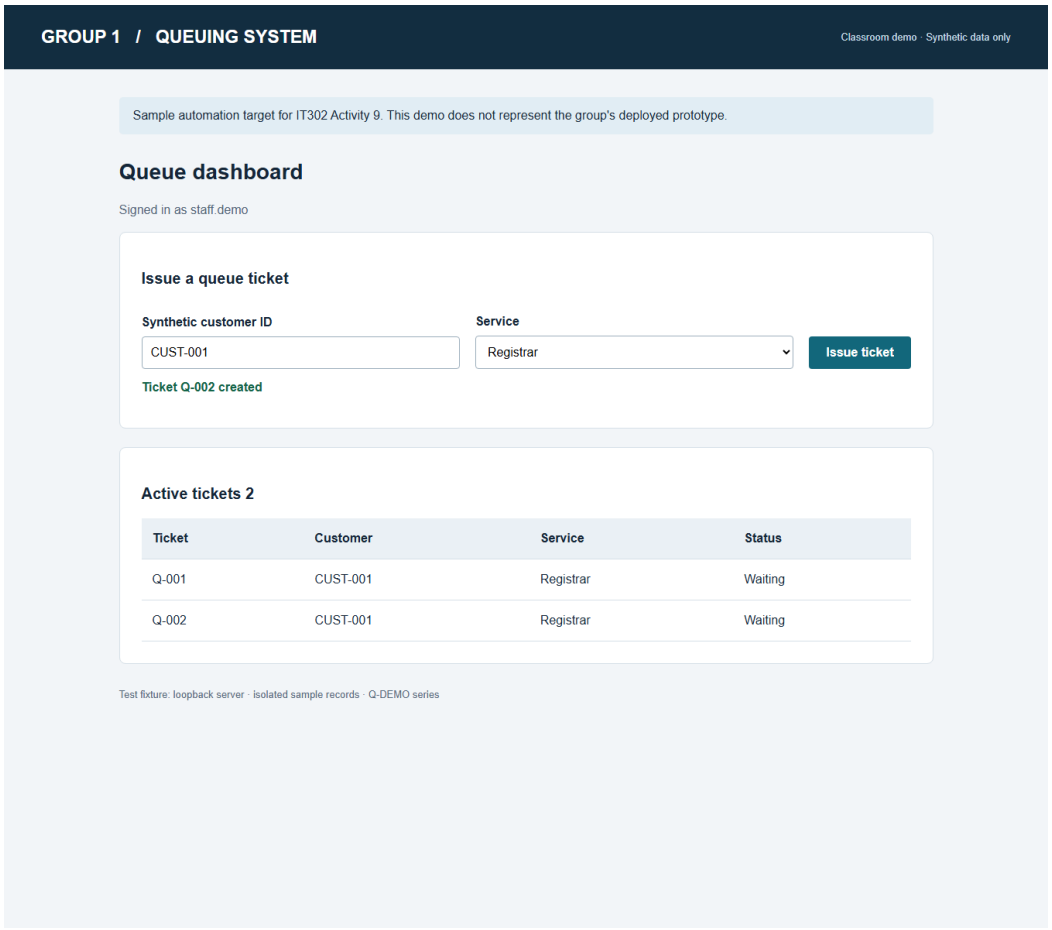

Build / Run	Pass	Fail	Completion	Pass rate	Duration
Q-DEMO-1.0-bug / 1	4	1	100%	80%	61.45 s
Q-DEMO-1.1-fixed / 2	5	0	100%	100%	75.36 s

Five planned and completed cases per run; zero errors, blocked or not-run cases in these records. JUnit suite durations include setup/teardown. Original raw evidence and exact timestamps are retained under evidence/run-01 and run-02. The HTML index links logs, screenshots and XML.

QDEF 001 Duplicate ticket defect

Affected sample: Q-DEMO-1.0-bug | AUTO-Q04 / QTC-04 / QR4

With a clean ticket store, log in and issue a Registrar ticket for CUST-001 twice. Expected: one active Waiting ticket; second request rejected. Observed: Q-001 and Q-002 both Waiting, and a second success message. This is a deliberately seeded sample product defect adapted from Activity 5 TC-06/R6; it is not the original enrollment defect itself.

Supplemental baseline capture: two active tickets for the same customer and service. The classroom-demo banner identifies the sample target. A taller-window recreation is retained under evidence/supplemental; original run captures and timestamps are unchanged.

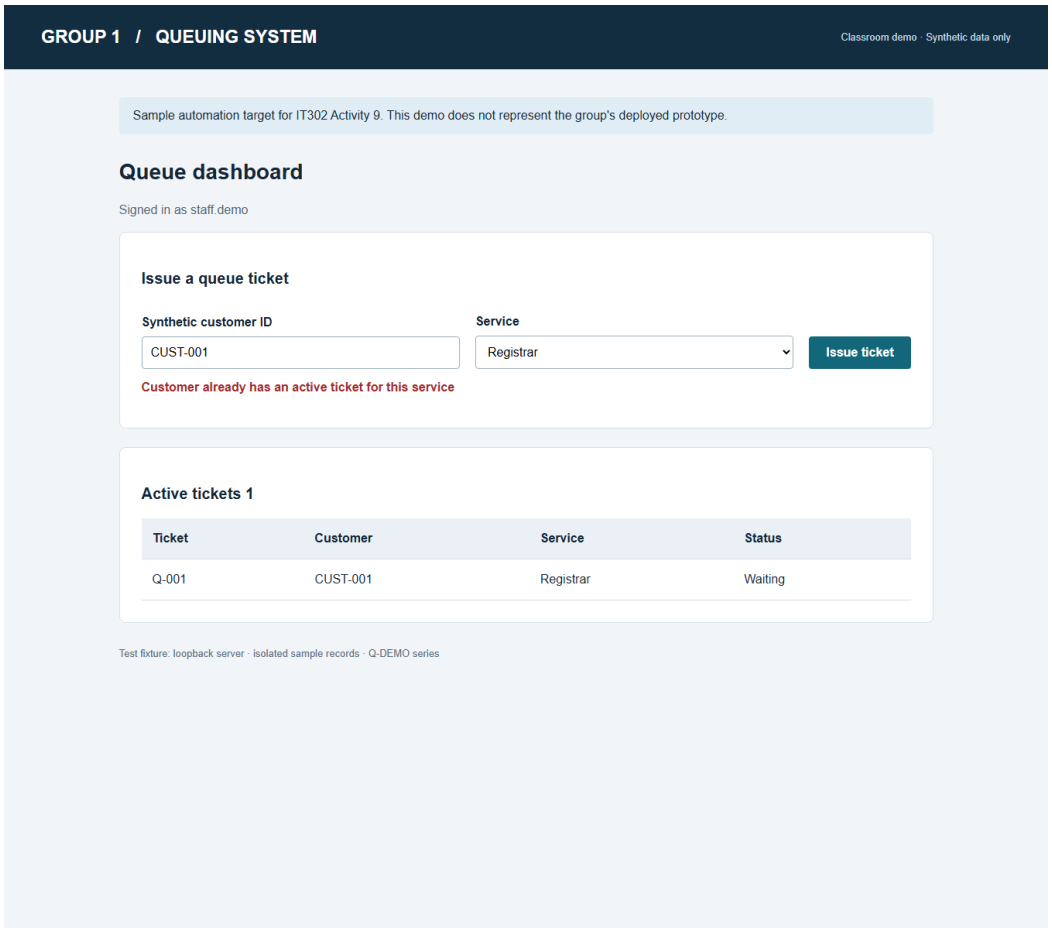

Triage and ownership

Severity High: duplicate positions compromise data integrity and service order. Priority P1: fix before releasing the affected sample. Raiza investigates record integrity; Lovely reviews the visible outcome; Shanley coordinates retest. Status: closed in fixed mode; deliberately reproducible using --demo-bug.

Correction: within the server lock, find an existing Waiting customer/service ticket, return the existing record with HTTP 409 and do not increment or insert. The test assertions remain unchanged. Recommendation for baseline: NO-GO.

Retest CI readiness and limits

Corrected sample: Q-DEMO-1.1-fixed | Same five Selenium cases

Supplemental fixed-state capture: duplicate rejection message, one active Q-001 and unchanged customer/service/status. A browser refresh assertion additionally confirms the retained record.

Retest and evidence

After an independent reset, all five cases passed in 75.36 seconds. This follows a specific product correction, not an unexplained retry. Evidence includes unchanged test source, JUnit XML, execution/console logs and screenshots. A preparation-only driver-resolution problem was corrected by updating Selenium and selecting Chrome before these recorded runs.

CI readiness

Supplied: pinned dependencies; README; configurable synthetic credentials; headless options; reset/cleanup; smoke markers; JUnit/screenshots; GitHub workflow with always-uploaded artifacts. PRs run two smoke cases; main runs five; nightly targets Chrome/Firefox at 02:00 Asia/Manila. Hosted CI and cross-browser results are pending validation.

Limits and exit decision

Five local Chrome cases meet the demo criterion, not real-prototype release approval. Call-next/FIFO, priority customers, queue capacity, concurrency, outage recovery, logout, real database durability and ten-run stability remain unverified. Persistence here means browser refresh of in-memory records. Confirm real requirements and run the adapted tests against the actual build before a release decision.
